## ASTM E 2149-20

Standard Test Method for Determining Antimicrobial Activity of Antimicrobial Agents Under Dynamic Contact Conditions

FINAL REPORT: R2O22-268-4A
*AMENDMENT TO R2O22-268-4

Testing Cert: \#2832.01

Testing Initiated: June 21, 2022
Testing Completed: June 27, 2022
Report Issued: July 20, 2022

Performed By: Agata Shulfer Title: Senior Staff Scientist

Approved By: Debbie Koester
Title: Quality Manager

## Objective:

To determine the antimicrobial activity of antimicrobial agents under dynamic contact conditions of four samples as seen by the ASTM E 2149-20 test method.

## Test Sample Identification*:

1. HardieFlex ${ }^{\circledR}$ sample 1
2. HardieFlex ${ }^{\circledR}$ sample 2
3. HardieFlex ${ }^{\circledR}$ NexGen ${ }^{\text {TM }}$ with MoldBlock ${ }^{\text {TM }}$ Technology sample 142037
4. HardieFlex ${ }^{\circledR}$ NexGen ${ }^{\text {TM }}$ with MoldBlock ${ }^{\text {™ }}$ Technology sample 142038

## Test Procedure Summary:

The test organism was adjusted and diluted to obtain a working bacterial inoculum solution. A flask for each sample and the "inoculum only" was prepared containing 50 mL of the working bacterial inoculum. Serial dilutions of the " 0 " contact time were performed on the "inoculum only" flask. The flask containing the test sample and the "inoculum only" flask were placed on the wrist action shaker for appropriate contact time. After shaking, serial dilutions were made and the plates incubated. After incubation, colonies of recovered bacteria are counted and used to determine percent and log reductions.

## Test Variables

Test Organism: Stachybotrys chartarum ATCC\#16026

| Sample Description: | Solid |
| ---: | :--- |
| Sample Weight/Size: | 2' $^{\prime \prime}$ 2" square cut into smaller pieces |
| Method of Sterilization |  |
| /Pre-Cleaning: | None |
| Dilution Medium Used: | Sterile buffer solution per standard |
| Buffer/Shake Solution Used: | Sterile buffer solution per standard |
| Serial Dilution Medium Used: | D/E Neutralizing Broth |
| Untreated Control: | Inoculum Only |
| Working Inoculum |  |
| Concentration: | S. chartarum ATCC\#16026: 1.2 x 105 |
| Contact Time: | 24 Hours |
| Deviations from | None, testing performed per ASTM E2149-20 |
| Standard Test Method: | without deviation. |

## Test Results:

The results for the test pieces can be found in the data table below. These results pertain only to the samples tested.

## Results against Stachybotrys chartarum ATCC\#16026:

## Percent reduction of bacteria per sample against inoculum only

| Time $=24$ Hours | Average Number of Bacteria Recovered (spores/ml) | Percent Reduction | Log <br> Reduction |
| :---: | :---: | :---: | :---: |
| Inoculum Only | $6.6 \times 10^{4}$ |  |  |
| HardieFlex ${ }^{\text {® }}$ Sample 1 | $4.9 \times 10^{4}$ | 26 | 0.13 |
| HardieFlex ${ }^{\text {® }}$ sample 2 | $3.5 \times 10^{4}$ | 47 | 0.28 |
| HardieFlex ${ }^{\circledR}$ NexGen ${ }^{\text {TM }}$ with MoldBlock ${ }^{\text {™ }}$ Technology sample 142037 | $7.3 \times 10^{3}$ | 89 | 0.95 |
| HardieFlex ${ }^{\circledR}$ NexGen ${ }^{\text {TM }}$ with MoldBlock ${ }^{\text {™ }}$ Technology sample 142038 | $5.8 \times 10^{2}$ | 99.1 | 2.06 |

Percent reductions and log reductions are determined by comparing the sample after the contact time to the "inoculum only" after the contact. Percent reduction is translated into log reduction by the following:
$90 \%$ reduction $=1 \log$ reduction; i.e. $1,000,000$ reduced to 100,000 is a $1 \log$ reduction $99 \%$ reduction $=2 \log$ reduction; i.e. $1,000,000$ reduced to 10,000 is a $2 \log$ reduction $99.9 \%$ reduction $=3 \log$ reduction; i.e. $1,000,000$ reduced to 1,000 is a $3 \log$ reduction $99.99 \%$ reduction $=4 \log$ reduction; i.e. $1,000,000$ reduced to 100 is a $4 \log$ reduction $99.999 \%$ reduction $=5 \log$ reduction; i.e. $1,000,000$ reduced to 10 is a $5 \log$ reduction
